

# Appendix B. Maximum Permissible Exposure

FCC ID: YZKECW7211L Page No. : B1 of B3

# Maximum Permissible Exposure

## 1.1. Applicable Standard

Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess limit for maximum permissible exposure. In accordance with 47 CFR FCC Part 2 Subpart J, section 2.1091 this device has been defined as a mobile device whereby a distance of 0.2 m normally can be maintained between the user and the device.

(A) Limits for Occupational / Controlled Exposure

Frequency Range (MHz)	Electric Field Strength (E) (V/m)	Magnetic Field Power Density (S) Strength (H) (A/m) (mW/ cm²)		Averaging Time  E ², H ² or S (minutes)	
0.3-3.0	614	1.63	(100)*	6	
3.0-30	1842 / f	4.89 / f	(900 / f)*	6	
30-300	61.4	0.163	1.0	6	
300-1500			F/300	6	
1500-100,000			5	6	

### (B) Limits for General Population / Uncontrolled Exposure

Frequency Range (MHz)	Electric Field Strength (E) (V/m)	Magnetic Field Strength (H) (A/m)	Power Density (S) (mW/ cm²)	Averaging Time  E  <sup>2</sup> , H  <sup>2</sup> or S (minutes)
0.3-1.34	614	1.63	(100)*	30
1.34-30	824/f	2.19/f	(180/f)*	30
30-300	27.5	0.073	0.2	30
300-1500			F/1500	30
1500-100,000			1.0	30

Note: f = frequency in MHz; \*Plane-wave equivalent power density

#### 1.2. MPE Calculation Method

E (V/m) = 
$$\frac{\sqrt{30 \times P \times G}}{d}$$
 Power Density:  $Pd$  (W/m²) =  $\frac{E^2}{377}$ 

E = Electric field (V/m)

P = Average RF output power (W)

G = EUT Antenna numeric gain (numeric)

**d** = Separation distance between radiator and human body (m)

The formula can be changed to

$$Pd = \frac{30 \times P \times G}{377 \times d^2}$$

From the EUT RF output power, the minimum mobile separation distance, d=0.2m, as well as the gain of the used antenna, the RF power density can be obtained.

Report No.: FR4D0491

# 1.3. Calculated Result and Limit

Exposure Environment: General Population / Uncontrolled Exposure

For 5GHz UNII Band:

Antenna Type: PCB Antenna

Conducted Power for IEEE 802.11ac VHT20: 25.87dBm

Distance (m)	Antenna Gain (dBi)	Antenna Gain (numeric)	The maximum combined Average Output Power		Power Density (S)	Limit of Power Density (S)	Test Result
(11)			(dBm)	(mW)	(mW/cm²)	(mW/cm²)	
0.2	5.77	3.7757	25.8735	386.6817	0.290606	1	Complies

Antenna Type: PCB Antenna

Conducted Power for IEEE 802.11ac VHT40: 24.02dBm

Distance	Antenna Gain (dBi)	Antenna Gain (numeric)	The maximum combined Average Output Power		Power Density (S)	Limit of Power	Test Result
(m)			(dBm)	(mW)	(mW/cm²)	Density (S) (mW/cm²)	ledi kedali
0.2	5.77	3.7757	24.0183	252.2513	0.189576	1	Complies

#### For 2.4GHz Band:

Antenna Type: PCB Antenna

Conducted Power for IEEE 802.11n 20MHz: 25.76 dBm

Distance	Antenna Gain (dBi)	Antenna Gain (numeric)	The maximum combined Average Output Power		Power Density (S)	Limit of Power	Test Result
(m)			(dBm)	(mW)	(mW/cm²)	Density (S) (mW/cm²)	
0.2	5.10	3.2359	25.7619	376.8671	0.242738	1	Complies

#### Conclusion:

Both of the WLAN 2.4GHz Band and WLAN 5GHz Band can transmit simultaneously, the formula of calculated the MPE is:

CPD1 / LPD1 + CPD2 / LPD2 + .....etc. < 1

CPD = Calculation power density

LPD = Limit of power density

Therefore, the worst-case situation is 0.242738 / 1 + 0.290606 / 1 = 0.533344, which is less than "1". This confirmed that the device comply with FCC 1.1310 MPE limit.
